CLAMPING SOLUTIONS

I About us

A KIFIX INDÚSTRIA E COMÉRCIO LTDA., Headquartered in the state of Rio Grande do Sul, in the city of Caxias do Sul, the company manufactures quick coupling clamps since 2004, offering more than 300 products of the highest quality, directed to a wide range of industrial activities, such as: Metalworking, furniture, chemical, food, automotive, auto parts, etc.

Were rely on experienced professionals who are at your disposal to help and solve your fixing problems.

The fastening system, called "quick clamping", is a tool that can be operated manually, pneumatically, hydraulically or electrically. It was first manufactured in 1936, so for over 70 years it has been solving fixing problems in industrial processes such as drilling, threading, welding, gluing, assembling and milling, etc.

Several quick clamping models are manufactured, such as vertical, horizontal, tensor, torpedo and pliers; and are made of galvanized carbon steel or stainless steel, with retention capacity of 50 to 1,800kg. Special sizes and types are made on demand.

We also have
**stainless steel clamps
& toggle-lock clamps**

QUICK CLAMPING SYSTEM

The quick clamping system has received various designations over time, for example: Clip, manual press, fastener, clamp (CLAMP -USA).

It originated in the United States of America in 1936. Today there are more than 100 manufacturers around the world.

This mechanism consists of a three-point joint known as "knee or elbow action", which provides a mechanical lock (see figure below) that generates a retaining force contrary to the applied force, which is released only if actuated purposefully.

In order to avoid random unlocking, we also offer quick coupling clamps with safety locks.

RETENTION FORCE

The retention force is proportional to the distance of the turning point (A) to the point of attachment of the tip (B / C).

The greater the distance between point A and the point of attachment of the tip, the least the retention force.

EXAMPLE

CLAMP X

The retention force is proportional to the distance of the turning point (A) to the point of attachment of the tip (B / C).

Distance AC: 135mm F1 (specified in the catalog) = 680 Kgf

Distance AB: 90mm F2 = $680 \times AC / AB = 680 \times 135 / 90 = 1.020$ Kgf
